

FleetFlow Change Report

Report date: 21 August 2026

Scope: changes applied during this working session in response to the Milestone Task List requirements and startup/login issues.

Important: the repository already contained other uncommitted changes before this session.

This report lists only work completed or directly corrected during this session.

1. Background scheduling added

Added Celery and Redis dependencies and REDIS_URL configuration.

Added backend/app/celery_app.py with hourly maintenance-alert scheduling and 10-minute delayed-shipment scheduling.

Added task modules that use their own database sessions: maintenance due within seven days are logged, and shipments in transit for over 24 hours are marked Delayed.

2. Role and data-access corrections

Drivers can view only their assigned vehicle and their own driver profile.

Attendance endpoints now require authentication; drivers are scoped to their own attendance, managers can manage records, and deletion is Admin-only.

Notifications are scoped to their recipients; only Admin can view all or delete them.

Dispatchers can create only unassigned shipments and can update shipment status only.

Vehicle hard deletion is Admin-only.

3. Startup and login fixes

Corrected uvicorn dependency spelling in requirements.txt.

Reworked run.py to install missing dependencies, run Alembic through its supported Python API, and start Uvicorn safely on Windows paths containing spaces.

Added a development JWT secret fallback and documented SECRET_KEY in backend/.env.example.

Pinned bcrypt to 4.0.x because Passlib 1.7.x and bcrypt 5.x crash during password verification. Login hashing and a real API login smoke test now pass.

4. Frontend corrections

Updated Attendance, GPS Tracking, Leave Requests, and Trips data-loading effects to comply with the React lint rule and prevent the reported lint failures.

Production frontend build completes successfully.

Files changed in this session

run.py

backend/requirements.txt; backend/.env.example; backend/app/core/security.py

backend/app/celery_app.py; backend/app/tasks/__init__.py; backend/app/tasks/maintenance.py;

backend/app/tasks/shipments.py

backend/app/routers/vehicle.py; driver.py; attendance.py; notification.py; shipment.py

frontend/src/pages/Attendance.jsx; GPSTracking.jsx; LeaveRequests.jsx; Trips.jsx

Verification performed

Python compilation passed.

Celery task registration passed.

Frontend ESLint and production build passed.

PostgreSQL migration and FastAPI startup passed.

Health endpoint and isolated login API smoke test passed.

Run command

From the project root: `python run.py`

The launcher builds the frontend, applies database migrations, and serves the integrated app at `http://127.0.0.1:8000`.
